

Introduction

The latest international evaluation for dairy **production** traits took place as scheduled at the Interbull Centre. Data from thirty-four (34) countries were included in this evaluation.

International genetic evaluations for milk, fat and protein yields of bulls from Australia, Austria-Germany, Belgium, Canada, Croatia, Czech Republic, Denmark-Finland-Sweden, Estonia, France, Hungary, Ireland, Israel, Italy, Japan, Latvia, Lithuania, Netherlands, New Zealand, Norway, Poland, Republic of South Africa, Slovak Republic, Slovenia, Spain, Switzerland, the United Kingdom, the United States of America, Portugal, Korea, Uruguay and Mexico were computed. Brown Swiss, Guernsey, Holstein, Jersey, Red Dairy Cattle and Simmental breed data were included in this evaluation.

Changes in national procedures

Changes in the national genetic evaluation of production traits are as follows:

BEL HOL Some corrections were made in our pedigree and therefore some bulls lost information (daughters, herds) leading sometimes to decreases in EDC and in reliabilities, improvement of our program that determines the type of proof for bulls

FRA BSW/HOL Some animals changed from official to unofficial as they do not
SIM pass the publication rules anymore

JPN HOL Little changes in proofs caused by additional records and modification of pedigree.

NOR RDC The rolling definition of hys is causing the daughters to distribute somewhat differently over hys-classes at each evaluation. Therefore some bulls occasionally may lose EDC although the number of daughters stay the same. Reliability changes is a function of the EDC changes. They deliver RBV's for all traits. The scaling is according to a rolling base that change somewhat at each evaluation causing slight changes in sire standard deviation.

EST HOL/RDC Decrease in number of daughters/herds of some bulls is due to the update of field data.

SVN HOL/BSW Some decrease in information (herds/daughters/EDC) These changes are mostly consequences of changes in data base related to the pedigree completeness as well as phenotypic data improvement.

SVN SIM Some decrease in information (herds/daughters/EDC) These changes are mostly consequences of changes in data base related to the pedigree completeness as well as phenotypic data improvement.

DEU HOL In general small decreases in number of daughters and/or herds are caused by data/pedigree corrections.

ZAF HOL/JER Some clean-ups on data were done, especially with regards to RDC alias numbers of foreign bulls.

CHE BSW/HOL/SIM Many bulls with decreases in herds/daughters/EDC. In most of the cases the decreases are very small. The reason for this can be found in the continuous work on the raw data by herd-book organizations.

NZL ALL Decrease in information due to continuous parentage verification

IRL HOL Update calculations of type of proof

IRL SIM Base change

ESP HOL Base change
AUS HOL Data corrections have been done resulting in some extreme changes in BVs.

INTERBULL CHANGES COMPARED TO THE DECEMBER ROUTINE RUN

Sub-setting:

As decided by the ITC in Orlando, new sub-setting was introduced in the September test run. Sub-setting is necessary for operational purposes and restrictions of time scales. To minimize the effect of sub-setting, larger subsets with 10-12 countries and with 4 link providing countries have been applied.

Window:

According to the decision taken by ITC in Orlando, the following changes have been introduced in regards to the windows used for post processing:

The upper bounds have been set to 0.99 as these were judged to have very little effect on evaluations. The lower values have been set to about the 25% percentile value. The largest changes are for the lower values for conformation traits, with the lowest window being 40% for OFL otherwise it is about 50% for all other confirmation traits. It is anticipated that these low values may not have large impact on evaluations since there were very few countries combinations whose estimated correlations fell between the old limit of 0.30 and these new limits.

DATA AND METHOD OF ANALYSIS

Data were national genetic evaluations of AI sampled bulls with at least 10 daughters or 10 EDC (for clinical mastitis and maternal calving traits at least 50 daughters or 50 EDC, and for direct calving traits at least 50 calvings or 50 EDC) in at least 10 herds. Table 1 presents the amount of data included in this Interbull evaluation for all breeds.

National proofs were first de-regressed within country and then analysed jointly with a linear model including the effects of evaluation country, genetic group of bull and bull merit. Heritability estimates used in both the de-regression and international evaluation were as in each country's national evaluation.

Table 2 presents the date of evaluation as supplied by each country

Estimated genetic parameters and sire standard deviations are shown in APPENDIX I and the corresponding number of common bulls are listed in APPENDIX II.

SCIENTIFIC LITERATURE

The international genetic evaluation procedure is based on international work described in the following scientific publications:

International genetic evaluation computation:
Schaeffer. 1994. J. Dairy Sci. 77:2671-2678
Klei, 1998. Interbull Bulletin 17:3-7

Verification and Genetic trend validation:
Klei et al., 2002. Interbull Bulletin 29:178-182.
Boichard et al., 1995. J. Dairy Sci. 78:431-437

Weighting factors:
Fikse and Banos, 2001. J. Dairy Sci. 84:1759-1767

De-regression:

Sigurdsson and G. Banos. 1995. Acta Agric. Scand. 45:207-219
Jairath et al. 1998. J. Dairy Sci. Vol. 81:550-562

Genetic parameter estimation:

Klei and Weigel, 1998, Interbull Bulletin 17:8-14
Sullivan, 1999. Interbull Bulletin 22:146-148

Post-processing of estimated genetic correlations:
